Getting Started

1. Unpack your CDR Tool and check contents.
2. Install the current version of the Bosch CDR software. Download the software from the Crash Data Group website under the Software tab.
3. Activate your software. You will receive an email from Bosch with an attached .CTF file and instructions for activation.
4. Open the CDR software and review the CDR Help File. **Help > Bosch CDR Help**

The CDR Help File includes a comprehensive getting started guide and tutorial for first time users. It also includes Vehicle & Cable Look Up, Collecting Data, Using Collected Data, Software Menu Selection & Toolbars and a Glossary of terms. The Help File is an indispensable tool for the CDR user.

5. Install the USB-to-Serial driver program. The link to the most current version is located in the Help File - simply search for "USB".
6. Practice! If your car or a friends car is supported (check the Help File), try using the CDR Tool on those vehicles. There might not be any crash data or recorded events, but the process is the same and will generate a CDR report.
7. The CDR Basic Kit includes a re-powering kit. This may be used to "re-power" a vehicle where the electrical system has been compromised. You can view a video tutorial at the Crash Data Group website in the Support section.
8. Also included in the CDR Tool Kit is the Bosch CDR User's Manual. You will find a mini-CD that contains information about using the CDR Tool.
